## NeoColab\_REC\_CS23221\_Python Programming

### REC\_Python\_Week 3\_CY

Attempt : 1  
Total Mark : 30  
Marks Obtained : 30

### Section 1 : Coding

#### 1. Problem Statement

A company is creating email accounts for its new employees. They want to use a naming convention for email addresses that consists of the first letter of the employee's first name, followed by their last name, followed by @company.com.

The company also has a separate email domain for administrative employees.

Write a program that prompts the user for their first name, last name, role, and company and then generates their email address using the appropriate naming convention based on their role. This is demonstrated in the below examples.

Note:

The generated email address should consist of the first letter of the first name, the last name in lowercase, and a suffix based on the role and company, all in lowercase.

### ***Input Format***

The first line of input consists of the first name of an employee as a string.

The second line consists of the last name of an employee as a string.

The third line consists of the role of the employee as a string.

The last line consists of the company name as a string.

### ***Output Format***

The output consists of a single line containing the generated email address for the employee, following the specified naming convention.

Refer to the sample output for the formatting specifications.

### ***Sample Test Case***

Input: John

Smith

admin

iamNeo

Output: jsmith@admin.iamneo.com

### ***Answer***

```
n=input()
m=input()
p=input()
q=input()
if p.islower():
    email=n[0].lower()+m.lower()+'@'+p+'.'+q.lower()+'com'
else:
    email=n[0].lower()+m.lower()+'@'+q.lower()+'com'
print(email)
```

**Status : Correct**

**Marks : 10/10**

## 2. Problem Statement

Sarah is a technical writer who is responsible for formatting two important documents. Both documents contain a certain placeholder character that needs to be replaced with another character before they can be finalized. To ensure consistency in formatting, Sarah wants you to help her write a program that processes both documents by replacing the placeholder character with the new one.

Sarah also prefers a neat and structured output, so she wants you to ensure that both modified documents are printed in a single line, separated by a space, using the `format()` function.

### Example

Input:

Hello

World

o

a

Output:

Hella World

Explanation:

Here the character 'o' is replaced with 'a' in the concatenated string.

### ***Input Format***

The first line contains `string1`, the first document.

The second line contains `string2`, the second document.

The third line contains `char1`, the placeholder character that needs to be replaced.

The fourth line contains `char2`, the new character that will replace the placeholder.

### **Output Format**

The output displays a single line containing the modified string1 and string2, separated by a space.

Refer to the sample output for the formatting specifications.

### **Sample Test Case**

Input: Hello

World

o

a

Output: Hella World

### **Answer**

```
n=input()
m=input()
p=input()
q=input()
a=n.replace(p,q)
b=m.replace(p,q)
print("{} {}".format(a,b))
```

**Status :** Correct

**Marks :** 10/10

## **3. Problem Statement**

Raj wants to write a program that takes a list of strings as input and returns the longest word in the list. If there are multiple words with the same length, the program should return the first one encountered.

Help Raj in his task.

### **Input Format**

The input consists of a single line of space-separated strings.

### **Output Format**

The output prints a string representing the longest word in the given list.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: cat dog elephant lion tiger giraffe

Output: elephant

### **Answer**

```
lst=list(input().split())
largest=""
for i in lst:
    if len(i)>len(largest):
        largest=i
print(largest)
```

**Status :** Correct

**Marks : 10/10**
